

A grayscale photograph of an astronaut in a white suit operating a control panel with multiple digital displays. The astronaut's hand is visible, touching one of the screens. The displays show various data, including a circular radar-like interface on the left and a world map on the right. The background is dark, suggesting the interior of a spacecraft or space station.

# Executive Function – Critical Networks, Development

---

11/19/24

# The Gom Jabbar (*Dune*)

*“I hold at your neck the gom jabbar,” she said. ... “the gom jabbar. It kills only animals.”*

...

*“You will feel pain in this hand within the box. Pain. But! Withdraw the hand and I'll touch your neck with my gom jabbar - the death so swift it's like the fall of the headsman's axe. Withdraw your hand and the gom jabbar takes you. Understand?”*

*“What's in the box?”*

*“Pain.”*

...

*The old woman said; “You've heard of animals chewing off a leg to escape a trap? There's an animal kind of trick. A human would remain in the trap, endure the pain, feigning death that he might kill the trapper and remove a threat to his kind.”*

# What is executive function?

---

- An umbrella term for a set of higher-order cognitive processes and skills that enable goal-directed behavior, decision making, and self-regulation
- Three key components:
  - **Inhibition:** suppress impulses, resist distractions, delay gratification to maintain orientation towards a goal
  - **Working memory:** hold and manipulate relevant information
  - **Flexibility:** shift attention or strategies in response to changing environments or other constraints

# Brain size has increased in human evolution

- The human brain is 5x larger than would be expected for a mammal of the same body weight
- The proportion of cortex devoted to sensory processing decreases in primate and human evolution

# Frontal lobe expansion

- **Prefrontal cortex (PFC)** experienced most significant growth
- Complex problem-solving, empathy, theory of mind, moral reasoning
  - **Dorsolateral Prefrontal Cortex (dlPFC):** executive function, working memory, planning, cognitive flexibility
  - **Ventromedial Prefrontal Cortex (vmPFC):** decision-making, emotional regulation, social behavior

Fig. HE: Visualization of evolution of brains in primates based on the inner surface. The lobes, the sylvian fissure and the hindbrain (brainstem and cerebellum) are colorized for better orientation.

© 2009 Dahnke@http://dbm.neuro.uni-jena.de

# Parietal lobe expansion

- **Inferior parietal lobule (IPL)** performs multimodal integration (sensory information + motor planning), allowing for more sophisticated cognition and abstraction
  - spatial awareness, tool use, symbolic thought, action sequencing
- **Precuneus** associated with self-awareness, episodic memory, and visuospatial processing
- Both areas are critical components of the **default mode network (DMN)**

## PARIETAL LOBE SUBSTRUCTURES

## Default mode network

# These expansions were critical for coordinating networks

- Emergence of networks that regulate the sensorimotor loop
- **Frontoparietal control network (FPCN) = Central executive network (CEN)**
  - The main network for executive functioning
- Attentional networks benefited from this expansion, too

# Triple Network System

- Highest level governing system that regulates cognitive, emotional, attentional processes
- **Default Mode Network (DMN)**
  - Introspection, self-referential thinking, mind-wandering, memory retrieval, narrative formation, social cognition
- **Central Executive Network (CEN)**
  - Goal-directed behavior, working memory, decision-making, cognitive control, task orientation
- **Salience Network (SN)**
  - Detection and prioritization of relevant stimuli, network switching, allocation of attentional and cognitive resources

# Most task prioritization is inhibition

- “You” don’t really “come up” with any of your ideas of what to do
- They emerge from subconscious activity as a smattering of impulses, desires, and abstract plans
- You inhibit the undesired impulses and automatic responses to allow the chosen one to flourish
- This ability to self-regulate is perhaps the most important factor to success and wellbeing in life
  - Short and long-term goal achievement, conflict resolution, task management, effective communication, physical health maintenance, financial stability, resilience, emotional regulation

Start the day in a calm way

Practice problem-solving

Build a strong relationship

Use planners and calendars

Teach EF skills explicitly

Teach study skills and habits

Give clear and concise instructions

Give think time for processing

Use checklists

Establish routines

Incorporate movement

Model “think alouds”

# Stroop Task

---

- Easy to read the word because reading happens mostly automatically
- Difficult to say the color of an incongruent word, because you must inhibit the automatic reading function

Blue Orange Green Red Purple

Red Purple Blue Orange Green

Green Red Purple Blue Orange

Red Blue Green Orange Purple

# Productivity strategies

- It is important to develop personal strategies for how to get work done
- For most things in life, as long as you pass the basic competence threshold for the task, the rest of your success relies on self-regulation strategies

## Pomodoro Technique

1. List your tasks.
2. Set a 25-min timer.
3. Focus and work.
4. Take a 5-min break.
5. Repeat 4 times, then break for longer.

## 3/3/3 Method

From Oliver Burkeman. Do these daily:

- 3 Spend 3 hours working on an important project.
- 3 Complete 3 shorter urgent tasks or meetings.
- 3 Do 3 maintenance tasks to keep life running smoothly.

## Eisenhower Matrix

|               | Urgent      | Not Urgent   |
|---------------|-------------|--------------|
| Important     | Do it       | Schedule it  |
| Not Important | Delegate it | Eliminate it |

## Eat the Frog

Do your hardest task first. The rest will be easier.

"If it's your job to eat a frog, it's best to do it first thing in the morning. And if it's your job to eat two frogs, it's best to eat the biggest one first."

– Mark Twain

## Seinfeld Strategy

1. Set your goal.
2. Mark a calendar each day you do it.
3. Keep the streak as long as you can.
4. Never miss 2 days in a row.

## Time Blocking

|                   |
|-------------------|
| 9 - 12 Deep Work  |
| 12 - 12:30 Email  |
| 12:30 - 1 Lunch   |
| 1 - 2 Gym         |
| 2 - 2:30 Break    |
| 2:30 - 4 Meetings |

1. Identify what needs doing.
2. Group similar activities together.
3. Assign time slots for tasks.
4. Plot blocks on a calendar.
5. Stick to the schedule.
6. Take breaks between blocks.
7. Make changes if needed.

# Cognitive flexibility

- The mental ability to switch between thought processes, to update an understanding of rules and constraints, to adapt behavior to changing context
- **SN** detects relevant stimuli – especially unexpected stimuli – and signals a need to make adjustments
  - **Anterior Insula (AI)**: environment or internal changes, more general
  - **Anterior Cingulate Cortex (ACC)**: conflict and error adaptation, more specific to goal-orientation
- **CEN** implements goal-oriented adjustments
  - May couple with **DAN** to reorient attention for external planning
  - May couple with **DMN** for introspection, autobiographical planning

# Wisconsin Card Sorting Test (WCST)

- The rule will randomly change as the participant performs the task
- Tests the ability to learn what the new rule is and adapt to it
- **Perseveration:** impairment in ability to cognitively switch

The sample card is at the top and below it are three options

→  
The participant must investigate what the rule is based on the changing feedback upon the response and adapt their choices accordingly:

- If the rule is **color**, then option 1 is correct
- If the rule is **shape**, then option 2 is correct
- if the rule is **number**, then option 3 is correct

The participant does not know the rule explicitly, but must work to find out and remember the response feedback!

# N-Back Task

- Maintenance of working memory is critical skill for EF
- Ability to hold and manipulate information in the mind + the ability to selectively drop information as needed in order to replace with what is newly relevant
- **N-** refers to how many items back one must recall (**1, 2, 3-back**)
- **dIPFC** critical region for performance

Numbers will be presented one at a time. Take note of them. If the number on the screen is the same as the number two numbers before, press the spacebar.

# Executive Function Development

| Development Stage                            | Emerging Abilities                                                                                                                                                                                                   | Key Brain Networks                                                                                                                                                                                                                         | Milestones                                                                                                                                                                                                            |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
